
The process of turning baking soda into crack cocaine is not for the average smoker. This is because, while easy to do, it requires some special tools and chemicals that are not typically found around the house. However, there are exact instructions online on how to make crack with baking soda and Orajel. The process involves boiling the baking soda in a pot of water on the stove top until it turns into a thick mushy substance that resembles wet sand. This mixture is then poured into clean capsules where they are sealed shut with Orajel before being smoked. The baking soda undergoes the "smoking" process when the Orajel is heated up while placed on top of a hot surface. A hit is taken when the smoker places the capsules under their tongue while inhaling deeply for 5–10 seconds. The capsules are then swallowed, where they are digested in approximately 3 minutes. A hit of crack lasts between 8–12 seconds, with most users experiencing an intense rush of euphoria upon exhaling. The whole process takes less than 30 minutes to complete once all materials are collected and used properly. The end product yields about 20+ doses per batch, with each dose containing 200mg–300mg of pure methamphetamine hydrochloride (crystal meth). There are some risks involved with the baking soda and Orajel method, due to the fact that it can be dangerous and unpredictable. For example, the first batch of crack could be bad, where the first smoke is taken and poor results occur. Also, after smoking any substance through a pipe or crack pipe, the user must play it safe by beginning with a pinch of salt in order to minimize damage. Another risk is overdosing on sleeping pills or relaxants if taken at the wrong time during the day. One can also use a blow torch to boil the mixture to speed up the process, but it is not recommended as this could cause strong reactions and burn the mixture into a black tar that will not smoke properly. Orajel is commonly used because it contains benzocaine which acts as an anesthetic. Using Orajel however, has side effects such as dizziness, nausea and vomiting. If overdosed, Orajel can cause respiratory depression, which could result in death if proper precautions are not taken. Additionally, one should never smoke Orajel or baking soda with anything else apart from the ingredients that are mentioned above. There are also health risks associated with using this method of making crack. Baking soda can cause allergies, which result in hives, coughing and sneezing. Although rare, if fumes are inhaled they can lead to skin irritation or skin discoloration. Other side effects include dry mouth, sore throat and fever. Additives such as caffeine can be included to make the mixture last longer.
